Abstract

- In data loading and data processing, we first preprocess the data to eliminate duplicate and abnormal data. Then, in the data description part, the variables are preliminarily described, and the correlation between variables is simply analyzed

Part 1. Introduction

- According to the CDC, heart disease is one of the leading causes of death for people of most races in the US (African Americans, American Indians and Alaska Natives, and white people). About half of all Americans (47%) have at least 1 of 3 key risk factors for heart disease: high blood pressure, high cholesterol, and smoking. Other key indicators include diabetic status, obesity (high BMI), not getting enough physical activity or drinking too much alcohol. Detecting and preventing the factors that have the greatest impact on heart disease is very important in healthcare. Computational developments, in turn, allow the application of machine learning methods to detect "patterns" from the data that can predict a patient's condition.

- The dataset come from the CDC and is a major part of the Behavioral Risk Factor Surveillance System (BRFSS), which conducts annual telephone surveys to gather data on the health status of U.S. residents. As the CDC describes: "Established in 1984 with 15 states, BRFSS now collects data in all 50 states as well as the District of Columbia and three U.S. territories. BRFSS completes more than 400,000 adult interviews each year, making it the largest continuously conducted health survey system in the world.". The most recent dataset (as of February 15, 2022) includes data from 2020. It consists of 401,958 rows and 279 columns. The vast majority of columns are questions asked to respondents about their health status.

Part 2.Data Process and Description

Import dependences

In [47]:

```
# import package
import pandas as pd
import os
import numpy as np
import matplotlib.pyplot as plt
from sklearn.preprocessing import StandardScaler
from scipy.spatial.distance import pdist
from scipy.spatial.distance import squareform
from scipy.cluster.hierarchy import dendrogram, linkage
from scipy.cluster.hierarchy import ward, fcluster, leaders
from scipy.cluster import hierarchy
from scipy.sparse import csr_matrix
import networkx as nx
import seaborn as sns
import math
```

In [20]:

```
%matplotlib inline
```

In [16]:

```
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
import numpy as np
from sklearn.linear_model import Ridge
import warnings
sns.set_style("white")
%store -r
```

2.1 Pre-processing

In [6]:

```
# import source data
heart_df = pd.read_csv('./data/heart_2020_cleaned.csv')
```

In [22]:

```
#De duplication, de unmaned, de Nan
#When keep = 'first', keep the sample when the label appears for the first time, and discard all rep
#When inplace = false, return the dataframe after removing duplicates, and the original dataframe wi
# dropna(axis=1,how='all'). Dropna (axis = 0, how = 'Any ') deletes columns that are all Nan and any
def cleanData(data):
    cleaned_data = data.drop_duplicates(keep='first',inplace=False).loc[:, ~data.columns.str.contai
    return cleaned_data
```

In [24]:

```
# clean data
heart_df=cleanData(heart_df)
```

2.2 Preliminary data analysis

In [25]:

```
# Dataset's information
heart_df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
Int64Index: 301717 entries, 0 to 319794
Data columns (total 18 columns):
 #   Column                Non-Null Count  Dtype
---  -
 0   HeartDisease          301717 non-null object
 1   BMI                   301717 non-null float64
 2   Smoking               301717 non-null object
 3   AlcoholDrinking       301717 non-null object
 4   Stroke                301717 non-null object
 5   PhysicalHealth        301717 non-null float64
 6   MentalHealth          301717 non-null float64
 7   DiffWalking           301717 non-null object
 8   Sex                   301717 non-null object
 9   AgeCategory           301717 non-null object
10   Race                  301717 non-null object
11   Diabetic              301717 non-null object
12   PhysicalActivity       301717 non-null object
13   GenHealth             301717 non-null object
14   SleepTime             301717 non-null float64
15   Asthma                301717 non-null object
16   KidneyDisease          301717 non-null object
17   SkinCancer            301717 non-null object
dtypes: float64(4), object(14)
memory usage: 43.7+ MB
```

In [28]:

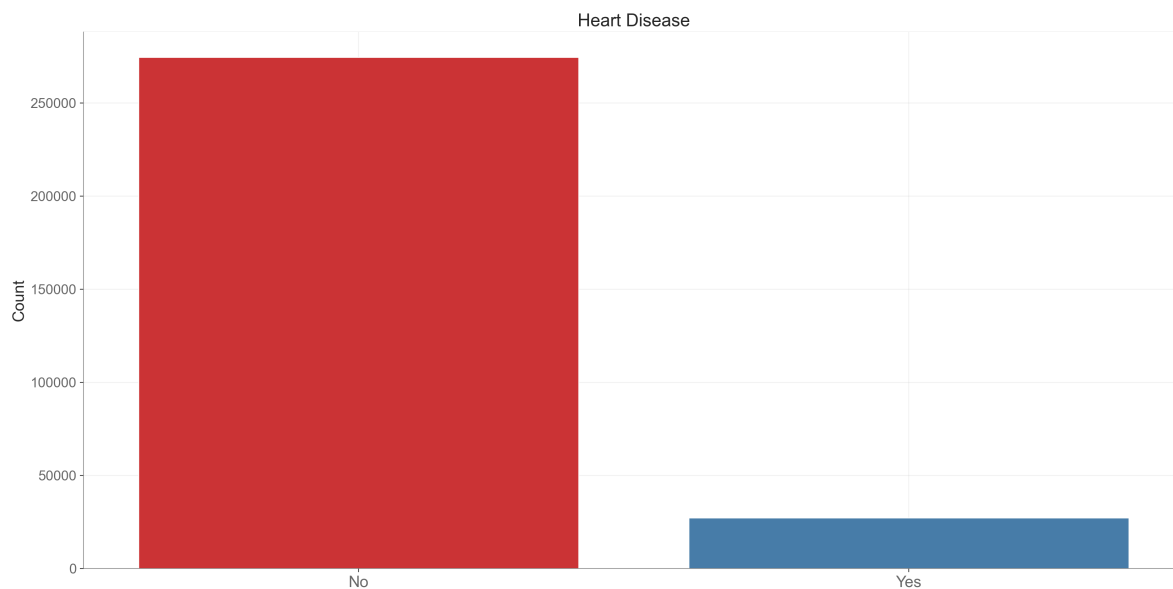

```
def countp(var):  
  
    # Plot  
    fig, ax = plt.subplots(figsize=(20,10), dpi= 200)  
    sns.countplot(data = heart_df, x=var, palette='Set1')  
  
    # Personalization  
    plt.title('Heart Disease', fontsize=18)  
    plt.xticks(rotation=0, fontsize=16, horizontalalignment='center', alpha=.7)  
    plt.yticks(fontsize=14, alpha=.7)  
    plt.grid(axis='both', alpha=.3)  
    ax.set_xlabel('', fontsize=16)  
    ax.set_ylabel('Count', fontsize=16)  
  
    plt.gca().spines["top"].set_alpha(0.0)  
    plt.gca().spines["bottom"].set_alpha(0.3)  
    plt.gca().spines["right"].set_alpha(0.0)  
    plt.gca().spines["left"].set_alpha(0.3)  
  
    return plt.show()
```

In [30]:

```
# Countplot for the variable "HeartDisease"  
countp(var='HeartDisease')
```

The figure above shows a significant imbalance between people with and without heart disease in the data set. Therefore, the EDA of classified data will use standardized values.

In [31]:

```
def barp(var, order=None):

    # Plot
    data_normalized = heart_df.groupby(f' {var}')['HeartDisease'].value_counts(normalize=True).renam

    fig, ax = plt.subplots(figsize=(20,10), dpi= 200)
    sns.barplot(x=var, y='Percentage', hue='HeartDisease', data=data_normalized, order=order, palet

    # Personalization
    plt.xticks(rotation=0, fontsize=16, horizontalalignment='center', alpha=.7)
    plt.yticks(fontsize=14, alpha=.7)
    plt.grid(axis='both', alpha=.3)
    plt.title('Heart Disease', fontsize=18)
    ax.set_xlabel(f' {var}', fontsize=18)
    ax.set_ylabel('Percentage (%)', fontsize=18)
    ax.legend(frameon=False, ncol=len(heart_df.columns), fontsize='xx-large')

    plt.gca().spines["top"].set_alpha(0.0)
    plt.gca().spines["bottom"].set_alpha(0.3)
    plt.gca().spines["right"].set_alpha(0.0)
    plt.gca().spines["left"].set_alpha(0.3)

    return plt.show()
```

In [32]:

```
# Barplot for "Smoking"
barp('Smoking')
```

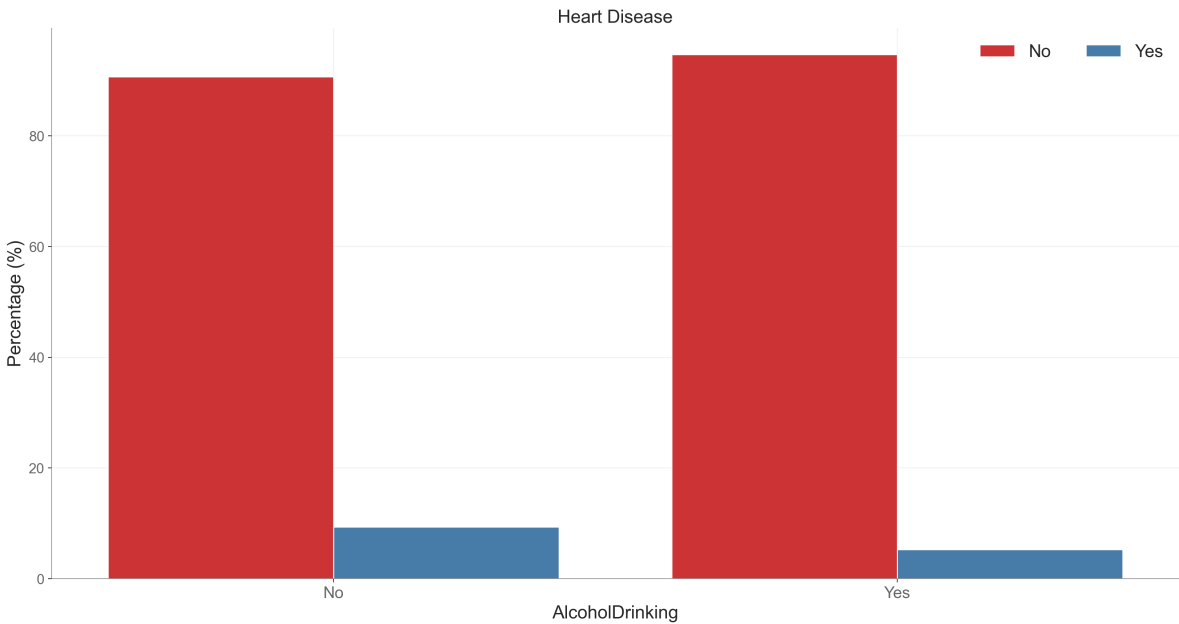

The chart above shows the significant prevalence of heart disease in people with smoking habits.

In [39]:

```
def barp(var, order=None):
    # Plot
    data_normalized = heart_df.groupby(f' {var}')['HeartDisease'].value_counts(normalize=True).renam
    fig, ax = plt.subplots(figsize=(20,10), dpi= 200)
    sns.barplot(x=var, y='Percentage', hue='HeartDisease', data=data_normalized, order=order, palet
    # Personalization
    plt.xticks(rotation=0, fontsize=16, horizontalalignment='center', alpha=.7)
    plt.yticks(fontsize=14, alpha=.7)
    plt.grid(axis='both', alpha=.3)
    plt.title('Heart Disease', fontsize=18)
    ax.set_xlabel(f' {var}', fontsize=18)
    ax.set_ylabel('Percentage (%)', fontsize=18)
    ax.legend(frameon=False, ncol=len(heart_df.columns), fontsize='xx-large')
    plt.gca().spines["top"].set_alpha(0.0)
    plt.gca().spines["bottom"].set_alpha(0.3)
    plt.gca().spines["right"].set_alpha(0.0)
    plt.gca().spines["left"].set_alpha(0.3)
    return plt.show()
```

In [40]:

```
# Barplot for "AlcoholDrinking"
barp('AlcoholDrinking')
```

The chart shows that the prevalence of heart disease is very high for people who do not drink alcohol.

Description of each variable in the dataset:

Variable	Description
HeartDisease	Respondents that have ever reported having coronary heart disease (CHD) or myocardial infarction (MI)
BMI	Body Mass Index (BMI)
Smoking	Have you smoked at least 100 cigarettes in your entire life?

Variable	Description
AlcoholDrinking	Heavy drinkers (adult men having more than 14 drinks per week and adult women having more than 7 drinks per week)
Stroke	(Ever told) (you had) a stroke?
PhysicalHealth	How many days during the past 30 days was your physical health not good?
MentalHealth	How many days during the past 30 days was your mental health not good?
DiffWalking	Do you have serious difficulty walking or climbing stairs?
Sex	Are you male or female?
AgeCategory	Fourteen-level age category
Race	Imputed race/ethnicity value
Diabetic	(Ever told) (you had) diabetes?
PhysicalActivity	Adults who reported doing physical activity or exercise during the past 30 days other than their regular job
GenHealth	Would you say that in general your health is...
SleepTime	On average, how many hours of sleep do you get in a 24-hour period?
Asthma	(Ever told) (you had) asthma?
KidneyDisease	Not including kidney stones, bladder infection or incontinence, were you ever told you had kidney disease?
SkinCancer	(Ever told) (you had) skin cancer?

2.3 Variable correlation analysis

In [44]:

```
def data_convert(df):
    if type(df) != pd.core.frame.DataFrame:
        raise ValueError('input is not a pandas dataframe')
    working_df = df.copy()
    cols = working_df.columns
    converted_columns = {}
    for col in cols:
        if working_df[col].dtype == 'O':
            unique_values = working_df[col].unique()
            converted_values = {v:k for k,v in enumerate(unique_values)}
            for value in unique_values:
                working_df[col] = working_df[col].replace(value, converted_values[value])
            converted_columns[col] = converted_values
    return working_df, converted_columns
```

In [45]:

```
cleaned_df, conversion_index = data_convert(heart_df)
```

In [46]:

```
sns.heatmap(cleaned_df.corr(), cmap='viridis_r')
```

Out[46]:

<AxesSubplot:>

Using the thermodynamic diagram, we can intuitively see the correlation between various variables. It can be seen that diffwalking is highly correlated with physical health. The correlation between heartdisease and agecategory is small.

Part 3.Model establishment and algorithm analysis

In []:
